```
This sequence represents a fragment of the amyloid beta peptide. The invention relates to the use of peptide compounds for inhibition of polymerisation of amyloid beta peptide (ABP), as model substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a tool for the identification of other organic compounds with similar functional properties, or as ligands in positron emission tomography. The peptides may be used in treatment of amyloidosis, especially in treatment of Alzheimer's disease associated with amyloidosis, for treatment or prevention of demens in patients with Down's syndrome, treatment or prevention of demens in patients with Down's syndrome, treatment or prevention of hereditary cerebral haemorrhage with man amyloid protein. They can also be used for identifying other molecules with similar properties and/or as ligands for detection of amyloid deposits using e.g. positron emission tomography.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a beta-amyloid inhibitor peptide. Beta-amyloid inhibitors have neuroprotective and nootropic properties. The inhibitor peptides are useful for the treatment of Alzheimer's disease. The present sequence represents a beta-amyloid recognition peptide used in the exemplification of present invention.

residues or non-amino acid fragments. Vaccines of the invention care produced using 'non-self' peptides synthesised from the cunnatural D-configuration amino acids to avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at cleast 1 region of an amyloid protein, e.g. the beta-sheet region or GAG-binding site region, the amyloid-beta peptide, or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidomimetics. Examples include all-D peptides corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 1-16, 16-21 and 36-42 of the amyloid-beta peptide and the all-D derivative peptides given in AAB82623-64. The vaccine elicits a preferential TH-2 or TH-1 response, preventing fibrillogenesis and cassociated cellular toxicity. The amyloid related diseases may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                on a portion of amyloid-beta peptide (see AAB82622), and may be modified by removing or inserting 1 or more amino acid residues, by substituting 1 or more amino acid residues with other amino ac residues or non-amino acid fragments. Vaccines of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of an all-D peptide suitable for use for preparing vaccines for preventing or treating Alzheimer's disease and other amyloid related disorders in humans. It is based to be a sequence of the present of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Preventing/treating amyloid-related disease, especially Alzheimer' disease, comprises administering antigenic all-D peptide, e.g. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        29-NOV-1999; 99US-0168594.

       The present sequence is that of an all-D peptide suitable for use in preparing vaccines for preventing or treating Alzheimer's disease and other amyloid related disorders in humans. It is bas on a portion of amyloid-beta peptide (see AABB262), and may be modified by removing or inserting I or more amino acid residues, by substituting I or more amino acid residues with other amino acy residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' peptides synthesised from the unnatural D-configuration amino acids to avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be
                                                                                                                                                                                                 Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, e.g. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A11-D
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              localised amyloidosis, e.g. diabetes type II, neurodegenerative diseases, e.g. bovine spongiform encephalitis, Creutzfeldt-Jakob disease, scrapie, cerebral amyloid angiopathy, and prion protein related disorders, or systemic amyloidosis associated with chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. rheumatoid arthritis), familial Mediterranean fever (FMF) and systemic amyloidosis found in long-term haemodialysis patients.
                                                                                                                                                                                                                                                                                                                                                             29-NOV-1999; 99US-0168594.

The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic
or GAG-binding site region, the amyloid-beta peptide, or their munogenic fragments, protein conjugates, immunogenic derivative manunogenic derivative peptides and immunogenic peptidemimetics. Examples include all-D peptides corresponding to residues 1.42, 1.40, 1.35, 1.28, 1.7, 10.16, 16.21 and 36.42 of the amyloid-beta peptide and the all-D derivative peptides given in AABB2623-64. The vaccine elicits a preferential TH-2 or TH-1 response, preventing fibrillogenesis and a sociated cellular toxicity. The amyloid related diseases may be cassociated disorders, e.g. diabetes type II, neurodegenerative disease, scrapie, cerebral amyloid angiopathy, and prion protein celated disorders, or systemic amyloidosis associated with chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. rheumatoid arthritis), familial Mediterranean fever (FMF) and systemic amyloidosis found in long-term haemodialysis patients.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore setul for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic
                                                                                                                                                                                                                                         Nootropic; neuroprotective; antifibrillogenic; amyloidosis inhibition; cytoprotection; amyloid deposit degradation; amyloidosis disorder; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to an amyloid-targeting imaging agent comprising CC an amyloid targeting moiety, a linker moiety and a labelling moiety. CC The agent is of general formula A_t-(A_1 n_k)_{z-A_1} a_b (I) where CC z = 0 - 1, A_t = an amyloid targeting moiety; Also included are imaging CC amyloid deposition or diagnosing an amyloid-related condition in a CC patient involving administering (I) to the patient, and ultrasound CC imaging (I) in the patient to determine the presence of amyloid or CC amyloid-related condition; and a kit for preparing a radiopharmaceutical preparation comprising (I), a reducing agent, a buffering agent, a cc transchelating agent, and instructions for the preparation and use of the CC condition. The agents are used for imaging amyloid or an amyloid-related condition. The agents are used for imaging amyloid deposition and for CC diagnosing an amyloid related condition e.g. Creutzfeldt-Jakob disease (CDD), kuru, transmissible cerebral amyloidoses (transmissible virus bovine spongiform encephalopathy (BSE), inflammation-associated amyloid, type II diabetes, primary amyloidosis, feline spongiform encephalopathy, CC con-renamissible cerebral amyloidosis, light con-related amyloidosis, cerebral amyloid angiopathy. The agents are cc capable of crossing the blood-brain barrier and are capable of binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      transmissible cerebral amyloidosis; transmissible virus dementia; scrapie; transmissible mink encephalopathy; BSE; type II diabetes; bovine spongiform encephalopathy; inflammation associated amyloid; primary amyloidosis; feline spongiform encephalopathy; Alzheimer's disease; prion-mediated disease; blood-brain barrier; dialysis-related amyloidosis; light chain-related amyloidosis; cerebral amyloidosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-bea40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral haemorrhage with amyloidosis of the Dutch type and haemorrhagic stroke. The present sequence represents one of a group of peptides (AAU11648-AAU11669, AAU11910 & AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide #6, used as a carrier for the amyloid-beta40 (Abeta40) inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40 inhibitor
                                                                                                                                                                 Gaps
specifically to amyloid plaques. The present sequence is a peptide forming the amyloid targeting moiety of the agent of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid angiopathy (CAA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                              The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary hamyloidosis of the Dutch type and hamorrhage with amyloidosis of the Dutch type and hamorrhagic stroke. The present sequence represents one of a group of peptides (AAU11648-AAU11669, AAU11910 & AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abbeta40) inhibitor. The Abbeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid angiopathy (CAA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Test peptide used in study of antagonism of amyloid beta protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

CC modulator compounds of the invention. Beta-amyloid peptide is a 4 CC kilodalton peptide that is the major protein component of amyloid plaques. Amyloid plaques are present both in the brain lesions, and in CC the walls of corebral blood vessels in Alzheimer's disease patients. CC The amyloid modulators of the invention comprise an amyloidogenic protein CC or peptide (such as this sequence) coupled directly or indirectly to at CC least one modifying group. The modifying group is preferably a cyclic, CC heterocyclic, or polycyclic group, such as declain, a cholanyl group, a CC biotin containing group, or a fluorescein containing group. These CC compounds then modulate the aggregation of these sequences to natural amyloidogenic proteins or peptides. The modulator compounds can be used CC amyloidogenic proteins or peptides. The modulator compounds can be used CC in the treatment of disorders associated with the natural CC amyloidogenic proteins or peptides. The modulator compounds such as CC isolated cardiac amyloidosis, systemic senile amyloidosis, such as CC isolated cardiac amyloidosts, systemic senile amyloidosis, such as CC isolated cardiac amyloidosts, systemic senile amyloidosis, such as CC diabetes, insullnoma, familial Mediterranean fever, familial amyloid
                                                           nephropathy with urticaria and deafness, hereditary cerebral haemorrhage and other types of amyloidosis. The modulators are also useful for the treatment of disorders associated with beta-amyloidosis, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modulators of amyloid aggregation protein coupled (in)directly to at

                                                                                                                                                                                                                                                                                                                                                ð
                                                                                                                                                                         This is a partial sequence of the amyloid beta peptide which is critical for its polymerisation. The invention relates to the use of peptide compounds for inhibition of polymerisation of amyloid beta peptide (ABP), as model substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP-ligands for inhibition of of polymerisation of ABP-ligands for inhibition of polymerisation of ABP, as a tool for the identification of other organic compounds with similar functional properties, or as ligands in positron emission tomography. The peptides may be used in treatment of mayloidosis, for treatment of Alzheimer's disease associated with amyloidosis, for treatment or prevention of demens in patients with Down's syndrome, for treatment or prevention of hereditary cerebral hamorrhage with amyloidosis (Dutch type) or for the prevention of them amyloid protein. They can also be used for identifying other molecules with similar properties and/or as ligands for for detection of amyloid deposits using e.g. positron emission
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

This sequence represents a fragment of the amyloid beta peptide. The invention relates to the use of peptide compounds for inhibition of polymerisation of amyloid beta peptide (ABP), as model substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a tool for the identification of other organic compounds with similar functional properties, or as ligands in positron emission tomography. The peptides may be used in treatment of amyloidosis, especially in treatment of Alzheimer's disease associated with amyloidosis for treatment or prevention of demens in patients with Down's syndrome, for treatment or prevention of hereditary cerebral haemorrhage with amyloidosis (Dutch type) or for the prevention of fibril formation of human amyloid protein. They can also be used for identifying other molecules with similar properties and/or as ligands for detection of amyloid deposits using e.g. positron emission tomography.
                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences AAW45962-6 represent a fragment of the amyloid beta peptide KLVPF with an amino acid residue replaced with alanine. The invention relates to the use of peptide compounds for inhibition of polymerisation of amyloid beta peptide (ABP), as model substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a tool for the identification of other organic compounds with similar functional properties, or as ligands in positron emission tomography. The peptides may be used in treatment of amyloidosis, especially in treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amyloid beta peptide, Alzheimer's disease, polymerisation, aggregation, positron emission tomography, PET, Down's syndrome, amyloidosis.
                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of new and known peptide(s) for inhibition of polymerisation of amyloid beta peptide - e.g. for treatment of Alzheimer's disease or Down's syndrome associated with amyloidosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ŝ

New conjugates are disclosed which are of formula A-Z, in which: A is (1) a cyclosporin A analogue described in AAW39087 or (2) an FK506 binding peptide inhibitor; and Z is a polypeptide comprising 5 or more contiguous residues of A-beta peptide. The compounds are novel chemical inducers of dimerization which are non-immunosuppressive and which are inhibitors of A-beta peptide aggregation and deposition in amyloid plaques. The adverse consequences of amyloid plaque formation can be prevented or ameliorated by sequestering the A-beta peptide in monomeric form with a conjugate which links the A-beta to cyclophilin or FKBP, therefore providing a mechanism to minimize the amount of free A-beta available for fibril formation and deposition. The compounds can be used for the treatment of Alzheimer's disease, multiple sclerosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Alzheimer's disease associated with amyloidosis, for treatment or prevention of demens in patients with Down's syndrome, for treatment evention of hereditary cerebral haemorrhage with amyloidosis (I type) or for the prevention of fibril formation of human amyloid protein. They can also be used for identifying other molecules wishilar properties and/or as ligands for detection of amyloid degrees and or as ligands for detection of myloid degrees.
                                                                                                                                                                                                                                                                                                                                                                                                                                       New A-beta-binding peptide conjugates and CsA analogs - use treatment of neurological diseases e.g. Alzheimer's disease,

Hundal A, K
Molineaux S,
                 The present invention describes beta-amyloid peptide (bAP) derivatives. The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid polymeuropathy or cardiomyopathy, bovine spongiform encephalopathy and Creutzfeldt-Jakob disease. The bAP derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bAP to labelled bAP derivatives. Some bAP derivatives inhibit bAP aggregation even when bAP is present in molar excess. The present sequence
                                                                                                                                                                                         New peptide(s) derived from beta-amyloid amyloid aggregation - and neurotoxicity, and prevention of Alzheimer's disease

                                                                                                                                                                                                                                                                                                         Beta-amyloid inhibitors have neuroprotective and nootropic properties. The inhibitor peptides are useful for the treatment of Alzheimer's disease. The present sequence represents a beta-amyloid recognition peptide used in the exemplification of present invention.
                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                     Beta-amyloid; inhibitor; recognition element; hybrid; aggregation; Alzheimer's disease; neuroprotective; nootropic.
                                                                                                                                                                                                                                                                                                  present invention describes a beta-amyloid inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                   Beta-amyloid inhibitor useful for treating Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Alzheimer's disease, amyloidosis, amyloid-related disease, vaccine, therapy, antigen.

residues or non-amino acid fragments. Veccines of the invention are produced using 'non-self' peptides synthesised from the unnatural D-configuration amino acids to avoid the drawbacks of unnatural D-configuration amino acids to avoid the drawbacks of operative or immunogenic. They preferably interact with at least 1 region of an amyloid protein, e.g. the beta-sheet region or GAG-binding site region, the amyloid-beta peptide, or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidomimetics. Examples include all-D peptides or responding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 1-7, 1-61-16, 16-21 and 36-42 of the amyloid-beta peptide and the all-D derivative peptides given in AAB82623-64. The vaccine elicits a secrited of a secrited and the all-daring amyloid aminogenic derivative peptides or TH-1 response, preventing fibrillogenesis and a secrited and the all-daring amyloid all-daring fibrillogenesis and a secrited and the all-daring amyloid all-daring fibrillogenesis and a secrited and the all-daring amyloid all-daring fibrillogenesis and a secrited and the all-daring amyloid all-daring fibrillogenesis and a secrited and the all-daring amyloid all-daring fibrillogenesis and and a secrited and all-daring amyloid all-daring fibrillogenesis and and and a secrited and all-daring amyloid all-daring and all-daring amyloid and all-daring amyloid all-daring amyloid and all-daring amyloid and all-daring amyloid all-daring amyloid all-daring amyloid and all-daring amyloid and all-daring amyloid and all-daring amyloid and all-daring amyloid all-daring amyloid all-daring and all-daring amyloid and all-daring amyloid and all-daring amyloid all-daring amyloid and all-daring amyloi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, e.g. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              use for preparing vaccines for preventing or treating Alzheimer's disease and other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see ABB82622), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Associated cellular toxicity. The amyloid related diseases may be localised amyloidosis, e.g. diabetes type II, neurodegenerative diseases, e.g. bovine spongiform encephalitis, Creutzfeldt-Jakob disease, scrapie, cerebral amyloid angiopathy, and prion protein related disorders, or systemic amyloidosis associated with chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) systemic amyloidosis found in long-term haemodialysis patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

                                                                                                                                                                        CC acids, which is capable of associating specifically with beta-strands converged by other protein or peptide molecules and there fore inhibiting their aggregation into extended beta-sheets. The peptides exhibit convursant; and cerebroprotective activity. The peptides in used for antiparkinsonian; and cerebroprotective activity. The peptides in vivo cor in vitro, for assisting the aggregation of proteins or peptides in vivo cor in vitro for assisting in the refolding of denatured or aggregated coroteins or peptides. The peptides can also be used for in vivo or in coroteins or peptides into insoluble beta fibres. The diseases include neurodegenerative diseases e.g. Alzheimer's disease, Parkinson's disease, coursed generative diseases e.g. Alzheimer's disease and kuru, coroteins or peptides into insoluble beta fibres. The diseases, and its human forms Creutzfeldt-Jakob diseases, Parkinson's disease, coroteins or diseases, X-linked spinal and bulbar muscular atrophy, coroteins of disease, X-linked spinal and bulbar muscular atrophy, coroteins of disease, X-linked spinal and bulbar muscular atrophy, coroteins of spinocerebellar ataxia, Non-neurodegenerative diseases such as type II diabetes mellitus, familial amyloidosis and dialysis-elated coroteins. The present sequence represents a fragment of the coroteins of disease related beta-amyloid peptide. The peptide is used in an example illustrating the use of a peptide of the invention.

Peptides AAB48474-B488496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for exacting amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a chemical compound or composition comprising a peptide with a beta strand forming section and associates with a target beta-strand formed by a separate peptide-containing molecule. The invention is useful for inhibiting or reversing the association of target beta-strand, formed by Alzheimer's Abeta peptide into a beta-sheet or beta-fibre and the aggregation of proteins or peptides.

                This invention describes novel amino acid or peptide derivatives or analogues (I), containing a modified side-chain (e.g. containing a group) which are transglutaminase inhibitors and Factor XIII/XIII a inhibitors. The products of the invention have ophthalmological, antiinflammatory, antirheumatic, antiarthritic, thrombolytic, neuroprotective, nootropic, antiseborrheic, dermatological cytostal anti-HIV and antipsoriatic activity. (I) are transglutaminase inhibitorseptically inhibitors of crosslinking of proteins or peptides (specifically fibrin and/or alpha 2-plasmin inhibitor), incorporation primary amines in proteins and peptides, hydrolysis of the gamma-carboxamido group of glutamine residues bound in proteins or partides hond factor vitil/VIII and mammalian human fiscule live.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloidosis and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region (
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New amino acid or peptide derivatives or analogs, are selective transglutaminase inhibitors useful e.g. for treating cataract, inflammatory diseases, rheumatoid arthritis, thrombosis, Alzhei

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            brain, eye lens, keratinocyte, epidermal, prostate, plant, parasitic and/or bacterial transglutaminases. The products of the invention can be used for treating cataract, inflammatory diseases, rheumatoid arthritis, chronic arthritis, thrombosis, Alzheimer's disease, Huntington's chorea, acne, cancer (by induction of apoptosis), HIV infections and psoriasis. (I) Are targeted and specific transglutaminase inhibitors, which can inhibit a specific type of transglutaminase in the human or animal body without affecting other transglutaminases. ABB84001-ABB84049 represent transglutaminase inhibitors described in the method of the invention.
The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting moiety, a linker moiety and a labelling moiety. The agent is of general formula A t \cdot (A \mid n \mid k) = A \mid a \mid b \mid (1) where z = 0 - 1; A \mid t = a n amyloid targeting molety; A \mid 1 \mid n \mid k = a linker moiety; and A \mid a \mid b = a labelling moiety. Also included are imaging amyloid deposition or diagnosing an amyloid-related condition in a patient involving administering (I) to the patient, and ultrasound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amyloid; imaging agent; Creutzfeldt-Jakob disease; Kuru; CJD; transmissible cerebral amyloidosis; transmissible virus dementia; scrapie; transmissible mink encephalopathy; BSE; type II diabetes; bovine spongiform encephalopathy; inflammation associated amyloid; primary amyloidosis; feline spongiform encephalopathy; Alzheimer's disease; prion-mediated disease; blood-brain barrier; dialysis-related amyloidosis; light chain-related amyloidosis;
                                                                                                                                                          New amyloid-targeting imaging agents useful plaques and/or for the treatment of amyloide
                                                                                                                                                                                                                                                                                                  25-JUL-2000;

Claim 49; Page 21; 57pp; English.

```
imaging (I) in the patient to determine the presence of amyloid or amyloid-related condition; and a kit for preparing a radiopharmaceutical preparation comprising (I), a reducing agent, a buffering agent, a distribution in the imaging and the preparation and use of the ranschelating agent, and instructions for the preparation and use of the radiopharmaceutical in the imaging of amyloid or an amyloid-related condition. The agents are used for imaging amyloid deposition and for diagnosing an amyloid related condition e.g. Creutzfeldt-Jakob disease (CJD), kuru, transmissible cerebral amyloidoses (transmissible virus dementias), familial CJD, scrapie, transmissible mink encephalopathy, bovine spongiform encephalopathy (BSE), inflammation-associated amyloid, type II diabetes, primary amyloidosis, faline spongiform encephalopathy, contransmissible cerebral amyloidosis, Alzheimer's disease, prion-mediated diseases, dialysis-related amyloidosis, light chain related amyloidosis, cerebral amyloid angiopathy. The agents are capable of trossing the blood-brain barrier and are capable of binding specifically to amyloid plaques. The present sequence is a peptide forming the amyloid targeting moiety of the agent of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New amyloid-targeting imaging agents useful for in vivo imaging amyloid plaques and/or for the treatment of amyloidosis disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Amyloid, imaging agent, Creutzfeldt-Jakob disease, Kuru, CJD, transmissible cerebral amyloidosis, transmissible virus dementia; scrapie, transmissible mink encephalopathy; BSE; type II diabetes; bovine spongiform encephalopathy; inflammation associated amyloid; primary amyloidosis; feline spongiform encephalopathy; Alzheimer's disease; prion-mediated disease; blood-brain barrier; dialysis-related amyloidosis; light chain-related amyloidosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

an amyloid targeting molety, a linker molety and a labelling molety.

The agent is of general formula A.L.(A.l.n.k) z-A.l.a b (I) where

z = 0 - 1; A.L. = an amyloid targeting molety. A.l.n.k = a linker

molety; and A.l.a b = a labelling molety. Also included are imaging

CC amyloid deposition or diagnosing an amyloid-related condition in a

patient involving administering (I) to the patient, and ultrasound

imaging (I) in the patient (I) to the presence of amyloid or

amyloid-related condition; and a kit for preparing a radiopharmaceutical

cc amyloid-relating agent, and instructions for the preparation and use of

transchelating agent, and instructions for the preparation and use of

condition. The agents are used for imaging of amyloid or an amyloid-related

condition. The agents are used for imaging anyloid deposition and for

diagnosing an amyloid related condition e.g. Creutzfeldt-Jakob disease

(CD), kuru, transmissible cerebral amyloidoses (transmissible virus

dementias), familial CUD, scrapie, transmissible mink encephalopathy,

bovine spongiform encephalopathy (BSE), inflammation-associated amyloid,

type II diabetes, primary amyloidosis, faline spongiform encephalopathy,

contransmissible cerebral amyloidosis, faline spongiform encephalopathy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Amyloid-beta40 inhibitor; Abeta40 inhibitor, cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide #8, used as a carrier for the amyloid-beta40 (Abeta40) inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     prion-mediated diseases, dialysis-related amyloidosis, light chain-related amyloidosis, cerebral amyloid angiopathy. The agents are capable of crossing the blood-brain barrier and are capable of binding specifically to amyloid plaques. The present sequence is a peptide forming the amyloid targeting moiety of the agent of the invention.
                                                                         an amyloid-targeting imaging agent comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contact a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention has been used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral haemorrhage with amyloidosis of the Dutch type and haemorrhagic stroke. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral haemorrhage with amyloidosis of the Dutch type and haemorrhagic stroke. The present sequence represents one of a group of peptides (AAUI1648-AAUI1669, AAUI1910 & AAUI1911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid angiopathy (CAA).
                                                                                                                                                      Inhibiting cerebral amyloid angiopathy used for treating e. Alzheimer's disease comprises contacting blood vessel wall amyloid-beta 40 inhibitor -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

                       The present invention describes an amyloid modulator compound (I) comprising an aggregation core domain and a modifying group attached to it (I) has nootropic, neuroprotective, immunosuppressive, antimicrobial, antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as a natural amyloid aggregation inhibitor and a neurotoxicity inhibitor of natural beta amyloid peptide (beta-AP). (I) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzheimer's disease and other clinical occurrences of beta amyloid deposition such as Down's syndrome individuals and in patients with hereditary cerebral haemorrhage with amyloidosis, and for treating a disorder associated with amyloidosis such as familial amyloid polyneuropathy. (I) reduces the toxicity of natural beta-AP aggregates to cultured neuronal cells. (I)

(I) has noctropic, neuroprotective, immunosuppressive, antimicrobial, antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as a natural beta amyloid aggregation inhibitor and a neurotoxicity inhibitor of natural beta amyloid peptide (beta-AP). (I) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzheimer's bown's syndrome individuals and in patients with hereditary cerebral haemorrhage with amyloidosis, and for treating a disorder associated with amyloidosis such as familial amyloid polyneuropathy. (I) reduces the toxicity of natural beta-AP aggregates to cultured neuronal calls. (I) not only reduces the formation of neurotoxic aggregates but also have the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Beta amyloid peptide; beta-AP; beta amyloid precursor protein; A-beta; APP-770; amyloid aggregation; amyloidogenic; Alzheimer's disease; nootropic; neuroprotective; immunosuppressive; antimicrobial; auditory; amtidiabetic; antipyretic; dermatological; cardiovascular; nephrotropic; amyloid aggregation inhibitor; neurotoxicity inhibitor; Down's syndrome; amyloidogenic disease; beta amyloid deposition; amyloidosis; hereditary cerebral haemorrhage; familial amyloid polyneuropathy.

Beta-amyloid peptide is a 4 kilodalton peptide that is the major protein component of amyloid plaques are present both in the brain lesions, and in the walls of cerebral blood vessels in Alzheimer's disease patients. The amyloid modulators of the invention comprise an amyloidogenic protein or peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, heterocyclic, or polycyclic group, such as declain, a cholanyl group, a biotin containing group, or a fluorescein containing group. These

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                compounds then modulate the aggregation of these sequences to natural amyloid proteins or peptides when contacted with the natural amyloidogenic proteins or peptides. The modulator compounds can be used in the treatment of disorders associated with amyloidosis, such as familial amyloid polyneuropathy, familial amyloid cardiomyopathy, isolated cardiac amyloidosis, systemic senile amyloidosis, scrapie, bovine spongiform encephalopathy, Creutzfeldt-Jakob disease, adult-onset diabetes, insulinoma, familial Mediterranean fever, familial amyloid nephropathy with urricaria and deafness, hereditary cerebral haemorrhage and other types of amyloidosis. The modulators are also useful for the treatment of disorders associated with beta-amyloidosis, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Beta-amyloid; modulator; amyloid plaque; brain lesion; amyloidosis; cerebral blood vessel; Alrheimer's disease; amyloidogenic protein; familial amyloid polyneuropathy; familial amyloid cardiomyopathy; isolated cardiac amyloidosis; systemic senile amyloidosis; insulinoma; bovine spongiform encephalopathy; Creutzfeldt-Jakob disease; urticaria; adult-onset diabetes; familial Mediterranean fever; therapy; deafness; scrapie; familial amyloid nephropathy; hereditary cerebral haemorrhage.
AAW02310-W02332 represent the peptide portions of the beta-amyloid modulator compounds of the invention. Beta-amyloid peptide is a 4 kilodalton peptide that is the major protein component of amyloid plaques are present both in the brain lesions, at the walls of cerebral blood vessels in Alzheimer's disease patients.
                                                                                                                              Modulators of amyloid aggregation protein coupled (in)directly to at treatment of Alzheimer's disease
                                                                                                                                                                                                                                              Benjamin H,
Hundal A,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC The amyloid modulators of the invention comprise an amyloidogenic protein CC or peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, cheterocyclic, or polycyclic group, such as declain, a cholanyl group, a compounds then modulate the aggregation of these sequences to natural camploid proteins or peptides when contacted with the natural camploid proteins or peptides when contacted with the natural cc amyloidogenic proteins or peptides. The modulator compounds can be used ci the treatment of disorders associated with amyloidosis, such as cf amilial amyloid polyneuropathy, familial amyloid cardiac amyloidosis, systemic senile amyloidosis, such as cc familial amyloid proteins or peptides. The modulator compounds can be used contacted with the natural cc included cardiac amyloidosis, systemic senile amyloidosis, such as cc familial amyloid proteins or peptides. The modulator cardiomyopathy, cc isolated cardiac amyloidosis, systemic senile amyloidosis, scrapie, cc diabetes, insulinoma, familial Mediterranean fever, familial amyloid cc nephropathy with urticaria and deafiness, hereditary cerebral haemorrhage and other types of amyloidosis. The modulators are also useful for the creatment of disorders associated with beta-amyloidosis, especially

Advantage compounds of the invention. Beca-amyloid peptide is a discontinuous of the invention. Beca-amyloid peptide is a discontinuous. Amyloid plaques are present both in the brain lesions, and in the walls of cerebral blood vessels in Alzheimer's disease patients. The amyloid modulators of the invention comprise an amyloidogenic protein or peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, beterocyclic, or polycyclic group, such as declain, a cholanyl group, a biotin containing group, or a fluorescent containing group, a fluorescent containing group, a compounds then modulate the aggregation of these sequences to natural amyloid proteins or peptides when contacted with the natural amyloid proteins or peptides. The modulator compounds can be used in the treatment of disorders associated with amyloidosis, such as familial amyloid polyneuropathy, familial amyloid cardiomyopathy, isolated cardiac amyloidosis, systemic senile amyloidosis, scrapie, bovine spongiform encephalopathy, Creutzfeldt-Jakob disease, adult-onset diabetees, insulinoma, familial Mediterranean fever, familial amyloid nephalopathy, creutzfeldt-Jakob disease, adult-onset and other types of amyloidosis, hereditary cerebral hemorrhage and other types of amyloidosis. The modulators are also useful for the treatment of disorders associated with beta-amyloidosis, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This sequence represents a fragment of the amyloid beta peptide. The invention relates to the use of peptide compounds for inhibition of polymerisation of amyloid beta peptide (ABP), as model substances for Use of new and known peptide(s) for inhibition of polymerisation of amyloid beta peptide - e.g. for treatment of Alzheimer's disease or Down's syndrome associated with amyloidosis. Example 1; Figure 2B; 31pp; English.

Tjernberg LO;

WPI; 1997-332723/30.

This sequence represents a fragment of the amyloid beta peptide. The invention relates to the use of peptide compounds for inhibition of polymerisation of amyloid beta peptide (ABP), as model substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a tool for the identification of other organic compounds with similar functional properties, or as ligands in positron emission tomography. The peptides may be used in treatment of amyloidosis, especially in treatment or Alzheimer's disease associated with amyloidosis, for treatment or prevention of demens in patients with Down's syndrome, treatment or prevention of hereditary cerebral haemorrhage with amyloidosis (Dutch type) or for the prevention of fibril formation of human amyloid protein. They can also be used for identifying other molecules with similar properties and/or as ligands for detection of amyloid deposits using e.g. positron emission tomography. ö synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a tool for the identification of other organic compounds with similar functional properties, or as ligands in positron emission tomography. The peptides may be used in treatment of amyloidosis, especially in treatment of Alzheimer's disease associated with amyloidosis, for treatment or prevention of demens in patients with Down's syndrome, for treatment or prevention of hereditary cerebral haemorrhage with amyloidosis (Dutch type) or for the prevention of fibril formation of human amyloid protein.                                                                              New conjugates are disclosed which are of formula A-Z, in which: A is (1) a cyclosporin A analogue described in AAW29087 or (2) an FK506 binding peptide inhibitor; and Z is a polypeptide comprising 5 or more contiguous residues of A-beta peptide. The compounds are novel chemical inducers of dimerization which are non-immunosuppressive and which are inhibitors of A-beta peptide aggregation and deposition in amyloid plaques. The adverse consequences of amyloid plaque formation can be prevented or ameliorated by sequestering the A-beta peptide in monomeric form with a conjugate which links the A-beta to cyclophilin or FKBP, therefore providing a mechanism to minimize the amount of free A-beta available for fibril formation and deposition. The compounds can be used for the treatment of Alzheimer's disease, multiple sclerosis and

                                                                                                                                                                                                                                                           inducers of dimerization which are non-immunosuppressive and which are inhibitors of A-beta peptide aggregation and deposition in amyloid plaques. The adverse consequences of amyloid plaque formation can be prevented or ameliorated by sequestering the A-beta peptide in monomeri form with a conjugate which links the A-beta to cyclophilin or FKBP, therefore providing a mechanism to minimize the amount of free A-beta available for fibril formation and deposition. The compounds can be use for the treatment of Alzheimer's disease, multiple sclerosis and amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New A-beta-binding peptide conjugates and CsA analogs - useful treatment of neurological diseases e.g. Alzheimer's disease, multiple sclerosis etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rich
                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         binding peptide inhibitor; and Z is a polypeptide comprising 5 or more contiguous residues of A-beta peptide. The compounds are novel chemical

                                                                                                                                                                                                                                                      29-DEC-1998
                                                                                                                                        Synthetic
  New conjugates are disclosed which are of formula A-Z, in which: A is (1) a cyclosporin A analogue described in AAW29087 or (2) an FKS06 binding peptide inhibitor; and Z is a polypeptide comprising 5 or more contiguous residues of A-beta peptide. The compounds are novel chemical inhibitors of dimerization which are non-immunosuppressive and which are inhibitors of A-beta peptide aggregation and deposition in amyloid plaques. The adverse consequences of amyloid plaque formation can be prevented or ameliorated by sequestering the A-beta peptide in monomeric form with a conjugate which links the A-beta to cyclophilin or FKBP, therefore providing a mechanism to minimize the amount of free A-beta available for fibril formation and deposition. The compounds can be used for the treatment of Alzheimer's disease, multiple sclerosis and amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                    onto the side chain of Lys(7) of the cyclosporin analog described in AAW29087, AAW29088, AAW29095 and AAW29097"
                                                                                                                                                                                                                                                      /note= "The omega-COOH group of Glu(1) is condensed

                                                                                                                                                                    The present invention describes beta-amyloid peptide (bAP) derivatives. The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid polyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and Creutzfeldt-Jakob disease. The bAP derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bAP to labelled bAP derivatives. Some bAP derivatives inhibit bAP aggregation even when bAP is present in molar excess. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
New peptide(s) derived from beta-amyloid peptide that inhibit amyloid aggregation - and neurotoxicity, specifically for treatment and prevention of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 6;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score

          Pred. No. is the number of results predicted by chance to have score greater than or equal to the score of the result being part and is derived by analysis of the total score distribution.
                                                                                                                                                                                         Score
